Factory design pattern is used when we have a super class with r we need to return one of the sub-class. This pattern take out the from client program to the factory class.

Let's first learn how to implement factory design pattern in java at advantages. We will see some of factory design pattern usage in **Factory Method Design Pattern**.

## Factory Design Pattern Super Class

Super class in factory design pattern can be an interface, **abstrac** factory design pattern example, we have abstract super class wit testing purpose.

```
package com.journaldev.design.model;

public abstract class Computer {

    public abstract String getRAM();
    public abstract String getHDD();
    public abstract String getCPU();

    @Override
    public String toString(){
        return "RAM= "+this.getRAM()+"", HDD="+
CPU="+this.getCPU();
    }
}
```

## Factory Design Pattern Sub Classes

### Let's Stay Connected X

*We promise not to spam you. You can unsubscribe at any time.*

Let's say we have two sub-classes PC and Server with below implementation:

```
package com.journaldev.design.model;

public class PC extends Computer {

    private String ram;
    private String hdd;
    private String cpu;

    public PC(String ram, String hdd, String cpu){
        this.ram=ram;
        this.hdd=hdd;
        this.cpu=cpu;
    }

    @Override
    public String getRAM() {
        return this.ram;
    }

    @Override
    public String getHDD() {
        return this.hdd;
    }
}
```

Notice that both the classes are extending `Computer` super class

```
package com.journaldev.design.model;

public class Server extends Computer {

    private String ram;
```

### Let's Stay Connected

```
private String hdd;
private String cpu;

public Server(String ram, String hdd, String c
    this.ram=ram;
    this.hdd=hdd;
    this.cpu=cpu;
}

@Override
public String getRAM() {
    return this.ram;
}

@Override
public String getHDD() {
    return this.hdd;
}
}
```

## Factory Class

Now that we have super classes and sub-classes ready, we can v  
implementation.

```
package com.journaldev.design.factory;

import com.journaldev.design.model.Computer;
import com.journaldev.design.model.PC;
import com.journaldev.design.model.Server;

public class ComputerFactory {

    public static Computer getComputer(String type
cpu){
        if("PC".equalsIgnoreCase(type)) return
        else if("Server".equalsIgnoreCase(type
cpu);

        return null;
    }
}
```

Some important points about Factory Design Pattern method are

1. We can keep Factory class **Singleton** or we can keep the method in the class.
2. Notice that based on the input parameter, different subclass is created by the factory method.

Here is a simple test client program that uses above factory design

```

package com.journaldev.design.test;

import com.journaldev.design.factory.ComputerFactory;
import com.journaldev.design.model.Computer;

public class TestFactory {

    public static void main(String[] args) {
        Computer pc = ComputerFactory.getComputer("pc", "2 GB", "500 GB", "2.4
        GHz");
        Computer server = ComputerFactory.getComputer("server", "16 GB", "1
        TB", "2.9 GHz");
        System.out.println("Factory PC Config:");
        System.out.println("Factory Server Config:");
    }
}
  
```

Output of above program is:

*We promise not to spam you. You can unsubscribe at any time.*

Factory PC Config::RAM= 2 GB, HDD=500 GB, CPU=2.4 GHz

Factory Server Config::RAM= 16 GB, HDD=1 TB, CPU=2.9 G

## Factory Design Pattern Advantages

1. Factory design pattern provides approach to code for interface
2. Factory pattern removes the instantiation of actual implementation  
pattern makes our code more robust, less coupled and easy to  
change PC class implementation because client program is
3. Factory pattern provides abstraction between implementation

## Factory Design Pattern Examples in JDK

1. java.util.Calendar, ResourceBundle and NumberFormat `get`
2. `valueOf()` method in wrapper classes like Boolean, Integer

How can I force users to compulsorily use the factory implementation to get the instance instead of getting away creating an instance directly using new operator.  
i.e. How can I force people to use ServerFactory.getInstance()

[Reply](#)

**Geeks says**

APRIL 10, 2018 AT 2:31 AM

You can make Server Class as an abstract class.

[Reply](#)

**abhi says**

APRIL 19, 2018 AT 3:47 AM

But in that case Your Factory wont be able to create

[Reply](#)

**Muthu Vignesh says**

MAY 5, 2018 AT 11:56 PM

If you can make the constructor private as per single  
the instance using new Server(); and only enforces to  
getInstance(). Also as an additional rule getInstance  
implemented in the sub-classes extending computer  
be present in Computer class which is already an abstract class. Hope m right, others correct  
me if m wrong

Sorry, that came out while copying the code from my Ec  
useless, I have removed them from above code.

[Reply](#)**Prashanth says**

NOVEMBER 15, 2017 AT 8:05 PM

It's a very good tutorial. But I have a doubt,

You mentioned Calendar#getInstance() as factory pattern implementation. But in this there is a small difference right?

There is no separate factory class. The super class Calendar itself is acting as the factory class.

Does an implementation like this have any advantage or disadvantage?

[Reply](#)**Luis Cunha says**

SEPTEMBER 8, 2017 AT 8:02 AM

Hi, is there a place in which I can download all the source code?

Yes. Its very nice article about simple factory covers basic concepts.

[Reply](#)

### Stephen Ubogu says

MAY 7, 2017 AT 4:09 AM

I am relatively new to design patterns but I need to ask this question. Can I create a subclass of computer say Laptop to the application.? Does this violate the computer factory class? This looks like violating the OO principle of open to extension but closed to modification.

[Reply](#)

### JocelynL says

OCTOBER 6, 2016 AT 3:28 AM

It seems to me that you're showing what is called a simple factory with ComputerFactory; It is not the Factory Method Pattern.

The client TestFactory delegates the creation to another class which it is composed with.

If you want to implement the Factory Method Pattern,:

1. ComputerFactory should define an abstract method getComputer(String ram, String hdd, String cpu)
2. ComputerFactory should have two subclasses PCFactory and ServerFactory which implements the superclass abstract method to return either a PC or a server
3. The client should be given one of the two concrete factories and call the factory method to get PC or servers, depending which one was instantiated

[Reply](#)

### catherine says

FEBRUARY 25, 2017 AT 6:24 PM

yes , i agree. the article is about simple factory not factory method.  
But still a nice article.

Thanks for the clear explanation.

I have one doubt here in Factory pattern. We have two concrete interface/Abstract class whose instances are created inside  
Computer pc = ComputerFactory.getComputer("pc","2 GB","500 GB");  
we can also use

Computer pc=new PC("pc","2 GB","500 GB","2.4 GHz"); to get the advantage of using ComputerFactory.getComputer() method

[Reply](#)

**Ofer Yuval says**

APRIL 22, 2015 AT 12:03 AM

See here

<http://stackoverflow.com/questions/14575457/factory-method>

[Reply](#)

**Ajay says**

APRIL 5, 2016 AT 11:29 AM

That's why it's called a creation all design pattern cause keeping the instance creation all logic here and there can be which is just doing it for us you just name it..name the object

[Reply](#)

**Avinash Nayak says**

SEPTEMBER 14, 2017 AT 10:31 AM

That's because you will be bound to the object, i.e. if you create Computer pc=new PC("pc","2 GB","500 GB","2.4 GHz") you will always get the instance of PC and it would be hardcoding. So if you use factory you will not worry of the implementation you will always get the object of reference Computer.

**JavaBee says**

MAY 16, 2016 AT 7:00 AM

May be its a late reply, but worth share thought here.

Factory classes(In general design patterns) are meant for pattern states that, the objective of this pattern is to decouple program. And this can be achieved either by static method.

Why we use singleton pattern when we have static? we use "static" when a piece of code/data same across of code that needs to be executed even when class is not required.

Question here is, how to make outer class itself static? The "singleton pattern" is a mechanism, which gives the class(avoid multiple instantiation of a class when it is not functionality only once) OR have the single instance to a This can be achieved by using static + additional checks

Ex: Thread pool.

[Reply](#)**robothy says**
