

# Code Smell Cheat Sheet

SYMPTOMS	CODE SMELL	NOTES
<ul style="list-style-type: none"><li>• Duplicated codes</li><li>• Same code structure or expression in more than one place</li></ul>	<b>Duplicated Code</b>	
<ul style="list-style-type: none"><li>• A long method</li></ul>	<b>Long Method</b>	<ul style="list-style-type: none"><li>- Long methods are bad because long procedures are hard to understand.</li><li>- Name a small method after the intention of the code, not implementation details. Small methods should have good names that reveal the intention of the code.</li><li>- "The key here is not method length but the semantic distance between what the method does and how it does it."</li></ul>
<ul style="list-style-type: none"><li>• A large class</li><li>• A class that's trying to do too much</li><li>• A class with too many instance variables</li></ul>	<b>Large Class</b>	
<ul style="list-style-type: none"><li>• A long parameter list</li></ul>	<b>Long Parameter List</b>	<ul style="list-style-type: none"><li>- Long parameter lists are bad because they are hard to understand and use and can easily become inconsistent.</li></ul>
<ul style="list-style-type: none"><li>• A class is commonly changed in different ways for different reasons</li><li>• A class suffers many kinds of changes.</li></ul>	<b>Divergent Code</b>	<p>What we want are:</p> <ul style="list-style-type: none"><li>- "When we make a change we want to be able to jump to a single clear point in the system and make the change."</li><li>- Each object is changed only as a result of one kind of change.</li><li>- Ideally, have a one-to-one link between common changes and classes.</li></ul>

# Code Smell Cheat Sheet

SYMPTOMS	CODE SMELL	NOTES
<ul style="list-style-type: none"><li>• A change requires alerting many classes</li><li>• When you want to make a kind of change, you need to make a lot of little changes to a lot of different classes.</li></ul>	<b>Shotgun Surgery</b>	"When the changes are all over the place, they are hard to find, and it's easy to miss an important change."
<ul style="list-style-type: none"><li>• A method seems more interested in another class than the one it actually is in.</li><li>• A method does not leverage data or methods from the class it belongs to. Instead, it requires lots of data or methods from a different class.</li></ul>	<b>Feature Envy</b>	
<ul style="list-style-type: none"><li>• Three or four data items clump together in lots of places such as fields in a couple of classes or parameters in many method signatures.</li></ul>	<b>Data Clumps</b>	- "Bunches of data that hang around together really ought to be made into their own object."
<ul style="list-style-type: none"><li>• Using multiple primitive data types to represent a concept such as using three integers to represent a date</li></ul>	<b>Primitive Obsession</b>	- Don't be afraid to use small objects for small tasks such as money classes that combine number and currency
<ul style="list-style-type: none"><li>• A switch statement that is duplicated in multiple, different places. If you add a new clause to the switch, you have to painstakingly find each scattered switch statement and change it.</li></ul>	<b>Switch Statements</b>	<ul style="list-style-type: none"><li>- "One of the most obvious symptoms of object-oriented code is its comparative lack of switch (or case) statements."</li><li>- Consider polymorphism when you see a switch statement.</li></ul>

# Code Smell Cheat Sheet

SYMPTOMS	CODE SMELL	NOTES
<ul style="list-style-type: none"><li>• Parallel inheritance hierarchies</li><li>• Every time you make a subclass of one class, you also have to make a subclass of another.</li><li>• Prefixes of the class names in one hierarchy are the same as the prefixes in another hierarchy.</li></ul>	<b>Parallel Inheritance Hierarchies</b>	- "Parallel inheritance hierarchies is really a special case of shotgun surgery."
<ul style="list-style-type: none"><li>• A class that isn't doing enough to pay for itself.</li></ul>	<b>Lazy Class</b>	- "Each class you create costs money to maintain and understand."
<ul style="list-style-type: none"><li>• The only users of a method or class are test cases.</li></ul>	<b>Speculative Generality</b>	- This happens when people thought they need a method or class for a future requirement but it turned out they didn't really need it.
<ul style="list-style-type: none"><li>• An instance variable is set only in certain circumstances.</li></ul>	<b>Temporary Field</b>	- "Such code is difficult to understand, because you expect an object to need all of its variables. Trying to understand why a variable is there when it doesn't seem to be used can drive you nuts."
<ul style="list-style-type: none"><li>• A method calling a different method which calls a different method which calls a different method ...</li></ul>	<b>Message Chains</b>	- A message chain couples a client of the method to the structure of the navigation. Any change to the intermediate relationships requires the client to have to change.

# Code Smell Cheat Sheet

SYMPTOMS	CODE SMELL	NOTES
<ul style="list-style-type: none"><li>• A class with lots of methods delegated to this other class</li></ul>	<b>Middle Man</b>	
<ul style="list-style-type: none"><li>• Classes delving in each others' private parts too much</li></ul>	<b>Inappropriate Intimacy</b>	
<ul style="list-style-type: none"><li>• Methods that do the same thing but have different signatures for what they do</li></ul>	<b>Alternative Classes with Different Interfaces</b>	
<ul style="list-style-type: none"><li>• Trying to modify a library class to do something you'd like it to do</li></ul>	<b>Incomplete Library Class</b>	
<ul style="list-style-type: none"><li>• Classes have nothing but fields and getters and setters for these fields.</li><li>• Classes act as dumb data holders and are manipulated in far too much detail by other classes.</li></ul>	<b>Data Class</b>	<ul style="list-style-type: none"><li>- "Data classes are like children. They are okay as a starting point, but to participate as a grownup object, they need to take some responsibility."</li></ul>

# Code Smell Cheat Sheet

SYMPTOMS	CODE SMELL	NOTES
<ul style="list-style-type: none"><li>• A subclass only uses a few methods or data given by the superclass (Unless it's causing confusion and problems, this smell is too faint to be worth cleaning.)</li><li>• A subclass does not want to support the interface of the superclass.</li></ul>	<b>Refused Bequest</b>	
<ul style="list-style-type: none"><li>• Using comments to explain what a block of code does</li></ul>	<b>Comments</b>	<ul style="list-style-type: none"><li>- Use comments to indicate areas you are not sure and to say why you did something.</li><li>- "When you feel the need to write a comment, first try to refactor the code so that any comment becomes superfluous."</li></ul>
